

Runbooks

ar007 · 7 July 2026

Runbooks are demolab’s **procedure layer** — named, repeatable jobs the agent runs step by step, showing each result and confirming before it moves on. Where a guide is always-on reference, a runbook is invoked when you want it: type its name in capitals (**LINT**, **DOCTOR**, **GETTING-STARTED**) and the agent opens it and drives it. Say **HELP** for the full menu. The canonical text is the Markdown source, linked below.

Getting in

- **GETTING-STARTED** — set up a fresh lab end to end: scaffold, brand, pick a stack, get it building and optionally published, then land a first experiment.
- **TOUR** — a guided walk through an existing repository, so you (or a new collaborator) learn where everything lives.

Checking the work

- **LINT** — audit the prose *and* the figures against the house style.
- **DOCTOR** — audit the repository’s structure against the rules.
- **RED-TEAM** — attack a result’s validity, hard, to surface what would break it.
- **STEELMAN** — build the strongest honest case for a result.
- **GROUND-CLAIMS** — back every claim with a run or a citation.
- **NEXT** — suggest what to run next.

Bringing work in

- **MIGRATE-CODE** — wrap an existing codebase, one experiment at a time, without rewriting the science.
- **MIGRATE-STACK** — switch the language your tools are written in (MATLAB, R, Julia, Octave).
- **FROM-JUPYTER** — convert a notebook into a tool, a runner, and a write-up.
- **FROM-PAPER** — reproduce a paper’s result from scratch.

Housekeeping

- **EMBED-DOCS** — use demolab as a docs subfolder inside another project.
- **UPDATE** — vendor the latest engine into your lab and review what changed between versions.

Their always-on counterpart — **guides** — has its own article in this collection.
