

Authoring a page

authoring · Created 23 August 2026

Every page is a `.typ` file under `writings/` exporting `meta` and `body`. Filenames are ordinary slugs; no numeric or experiment prefix is required.

Assets and data

Put images, video, downloads, or JSON under `assets/`. Writings read them directly. This page loaded a value from `assets/example.json`: **3**.

Organisation

Add `collection`, `description`, `status`, or `order` to `meta` when useful. Register named collections in `demolab.yaml` to control their labels, descriptions, order, and web theme.
